

# Reading Guide

## (version of march 10 2020)

This program was developed at the request of Thierry Danigo, consulting occupational therapist at the A.P.F. to replace the "VuBar" program which is no longer distributed.

It is intended to guide the vision of people who find it difficult to focus their attention on a screen.

The program displays a "minimum" window (without title bar or system buttons) which contains a colored frame in which, by transparency, we can see the content overflow.

We can intervene in the content visible through the "Reading Guide" window.

The program exits by clicking on the "Exit" button (red color)  
Language, position, dimensions, and colors are saved at this time.

At the opening we find the same window, or the last windows closed

The window moves with the mouse (click maintained) and resizes with the mouse, by "dragging" on the edges, or by the "handle" at the bottom right

A click on the "Lock Mouse" button allows the window to be moved by following the mouse. (mouse tracking) . Other actions are no longer possible. A second click stops this tracking function on the screen.

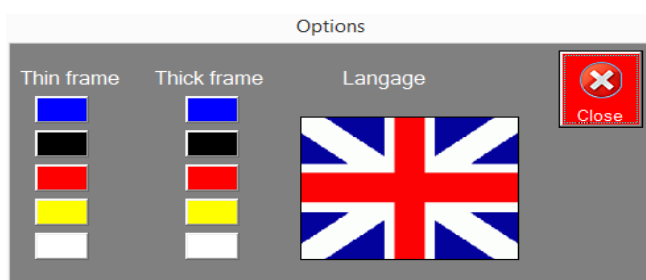

A click on the button "Icon" put the window in icon in the task bar

If you click on the "Options" button, you access the window below to set

- language (French or English in this version)
- the color and thickness of the frame.

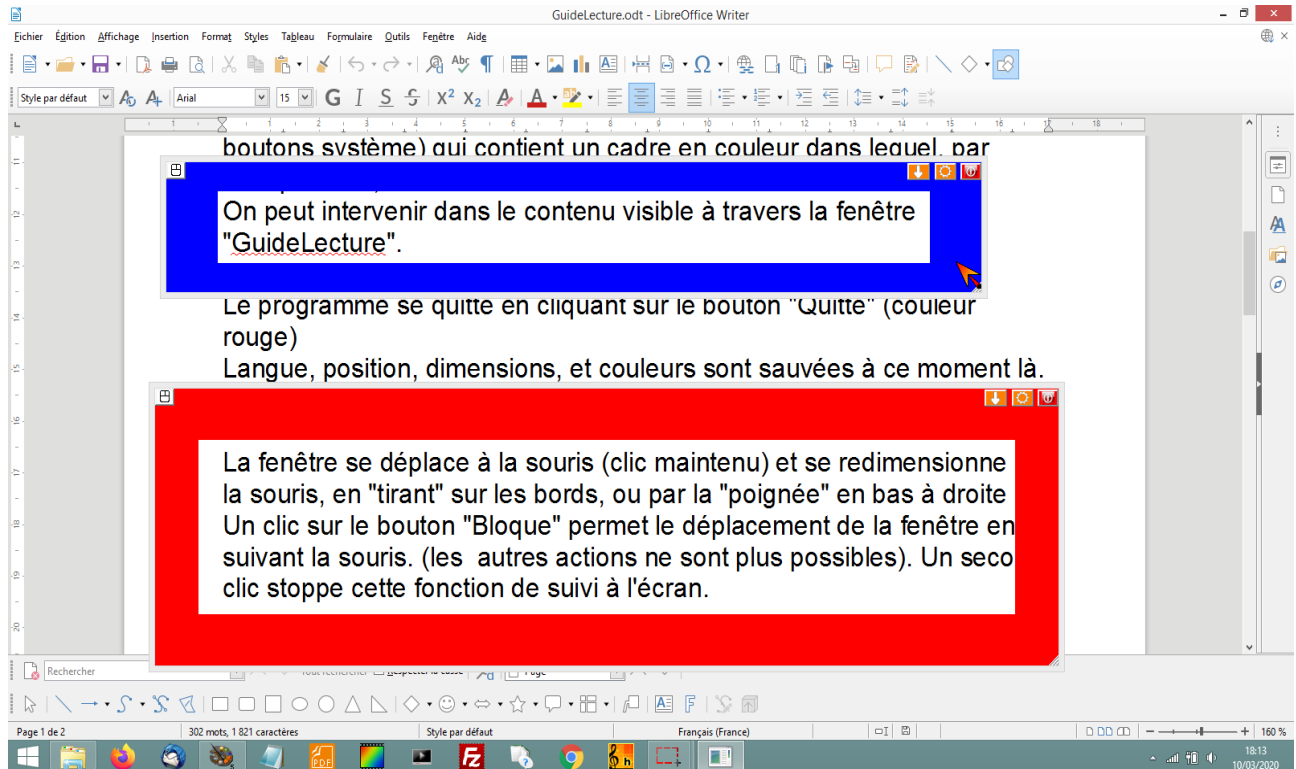

The light frame colors are suitable if a predominantly dark screen is used.

## Multi windows

This program can be opened several times: you can follow several zones on the screen.

Each open window is independent of the others: the settings can be different  
At the next launch, the settings will be those of the last window closed.
